Measure Title: DIAGNOSIS AND FOLLOW-UP OF PROSTATE CANCER

Disease State: Cancer

Strength of Recommendation: B

Organizations Providing Recommendation:
- American Society for Therapeutic Radiology and Oncology
- American Urological Association
- National Comprehensive Cancer Network

Clinical Intent:
To ensure that all eligible males diagnosed with prostate cancer receive the necessary follow-up monitoring services at a clinically appropriate frequencies.

Background:
Disease Burden:
- In the United States, prostate cancer is the most commonly diagnosed cancer in men, and the second most common cause of cancer death in men.[1]
- The American Cancer Society estimated that in 2007, approximately 218,890 men will be diagnosed with prostate cancer, and about 27,050 men will die from it.[1]
- Even though there is a 17% lifetime risk of developing prostate cancer, the risk of dying from prostate cancer is only about 3%.[1, 2]
- The relative five-year survival rate for patients with prostate cancer diagnosed in the local or regional stages approaches 100%, while the relative 10 and 15-year survival rates are 93% and 77%, respectively.[1]

Reason for Indicated Intervention or Treatment:
- Prostate specific antigen (PSA) screening after treatment for prostate cancer can help detect recurrences.[3]
- For patients deciding to undergo watchful waiting instead of receiving treatment after being diagnosed with prostate cancer, PSA testing can help differentiate between slower growing cancers and more aggressive ones, for which patients may elect to receive definitive treatment.[4]

Evidence Supporting Intervention or Treatment:
- A study of almost 1,800 prostate cancer patients showed that 77% of the 339 patients with recurrences were detected solely by an increase in PSA level, and 98% by an increase in PSA level plus local or distant recurrence.[3]
  - Few studies have examined the desired frequency of PSA monitoring, and there is no community standard.[6] A survey of 1,050 American Urological Association members showed...
appreciable variation in the frequency of PSA testing after radical prostatectomy for localized prostate cancer, though respondents generally recommended serum PSA testing every 3 months in the first year, every 6 months in years 2 to 5, and yearly thereafter.[7]

- There are some current large-scale studies that intend to examine the effects of PSA screening on patient mortality.[9-11] However the follow-up time for many of these studies is too short to provide data on mortality rates. The studies that do provide this data are mixed in opinion.
  - One large randomized controlled trial showed a benefit to PSA screening in a group of 46,486 men aged 45-80 years. A Cox proportional hazards model of the age at death from prostate cancer shows a 62% reduction (P < 0.002, Fisher's exact test) of cause-specific mortality in the screened men (P = 0.005).[12]
  - In another randomized controlled trial involving 9,026 men aged 50-69 years, there were 85 (5.7%) cancers detected in the screened group (SG), 42 of these in the interval between screenings, and 292 (3.8%) in the unscreened group (UG). In the SG 48 (56.5%) of the tumors and in the UG 78 (26.7%) were localized at diagnosis (p < 0.001). In the SG 21 (25%) and in the UG 41 (14%) received curative treatment. However, there was no significant difference in total or prostate cancer-specific survival between the groups.[13]

- However, information gained indicates repeated testing may be more useful in identifying cancers than a single test alone. The velocity with which PSA increases per year may improve specificity of the test; a PSA velocity exceeding 0.75 ng ml$^{-1}$ year$^{-1}$ has been associated with a higher risk of prostate cancer than a slower rise in PSA.[14] Furthermore, PSA velocity may predict time to relapse in patients with previous diagnoses of prostate cancer.[15]

Clinical Recommendations

- The American Urological Association (AUA), the National Comprehensive Cancer Network (NCCN) and the American Society for Therapeutic Radiology and Oncology (ASTRO) recommend checking PSA during the initial work up of prostate cancer.
- To detect disease recurrence, the AUA recommends periodically offering PSA testing in the post-treatment management of prostate cancer.[16]
- The appropriate frequency of testing is somewhat controversial [6], but most experts and organizations agree that follow-up PSA testing should be performed at least annually. Some experts recommend checking PSA levels every 6 months for the first two years after treatment, and then annually.[17] Others recommend tailoring the frequency of testing to the pathologic grade and stage.[18]
- The NCCN recommends that patients with a life expectancy ≥ 10 years who wish to undergo expectant management with PSA do so up to
every 3 months and at least every 6 months. For patients with life expectancy less than 10 years who wish to undergo expectant management, the NCCN recommends monitoring PSA less frequently. Patients initially treated with intent to cure should have their serum PSA level checked every 6 to 12 months for the first 5 years and then rechecked annually. For patients with locally advanced or metastatic disease, PSA should be checked every 3 to 6 months.[19]

- ASTRO recommends PSA testing every 3 to 4 months during the first two years following radiation therapy for prostate cancer, and every 6 months thereafter.[20]

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Diagnosis</strong></td>
<td>Measures applicable to patients receiving diagnostic workups for a symptom or condition that delineate appropriate laboratory or radiological testing to be performed (e.g. evaluation of thyroid nodule; pregnancy test in patients with vaginal bleeding or abdominal pain).</td>
</tr>
<tr>
<td><strong>Effectiveness of Care</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Prevention</strong></td>
<td>Measures applicable to asymptomatic individuals that are designed to prevent the onset of the targeted condition (e.g. immunizations).</td>
</tr>
<tr>
<td><strong>Screening</strong></td>
<td>Measures applicable to asymptomatic patients who have risk factors or pre-clinical disease, but in whom the condition has not become clinically apparent (e.g. pap smears; screening for elevated blood pressure).</td>
</tr>
<tr>
<td><strong>Disease Management</strong></td>
<td>Measures applicable to individuals diagnosed with a condition that are part of the treatment or management of the condition (e.g. cholesterol reduction in patients with diabetes; radiation therapy following breast conserving surgery; appropriate follow-up after acute event).</td>
</tr>
<tr>
<td><strong>Medication Monitoring</strong></td>
<td>Measures applicable to patients taking medications with narrow therapeutic windows and / or potential preventable significant side effects or adverse reactions (e.g. thyroid stimulating hormone (TSH) testing after levothyroxine dose change; hepatic enzyme monitoring for patients using antimycotic pharmacotherapy).</td>
</tr>
<tr>
<td><strong>Medication Adherence</strong></td>
<td>Measures applicable to patients taking medications for chronic conditions that are designed to assess patient adherence to medication (e.g. adherence to lipid lowering medication).</td>
</tr>
<tr>
<td><strong>Utilization</strong></td>
<td>Measures applicable to patients receiving treatment for a symptom or condition that advocate appropriate utilization of laboratory and pharmaceutical resources (e.g. conservative use of imaging for low back pain; inappropriate use of antibiotics for viral upper respiratory infection).</td>
</tr>

Strength of Recommendation Based on a Body of Evidence

**FIGURE 2.** Algorithm for determining the strength of a recommendation based on a body of evidence (applies to clinical recommendations regarding diagnosis, treatment, prevention, or screening). While this algorithm provides a general guideline, authors and editors may adjust the strength of recommendation based on the benefits, harms, and costs of the intervention being recommended. (USPSTF = U.S. Preventive Services Task Force)
